Infectious Coryza IC

Infectious Coryza, Avibacterium Paragallinarium vaccine
Serotypes A,C (A-W, A-221, C2-Modesto Strains)
Inactivated, W/O vaccine

Description
The vaccine contains inactivated *Avibacterium paragallinarum* bacteria, serotypes A (W, 221) and C2-Modesto strains in oil emulsion adjuvant

Indications
Infectious Coryza IC vaccine is indicated for the vaccination of breeders and layers chickens against infectious Coryza.

Dosage and Administration
Allow to reach room temperature before use. Shake the vaccine well before and during use. The vaccine is to be applied only by subcutaneous injection on the back between the wings, lateral to the spine or in the chest area.

Initial vaccination is recommended when chickens are over 8 weeks of age followed by a second vaccination 3-4 or more weeks before point of lay. In molted flocks, chickens should be re-vaccinated at the end of the first laying season and before the start of the second laying season.

Always consult your veterinarian as to the proper vaccination program.

Dose: 0.5ml / bird.

Precautions
- Only healthy birds should be vaccinated. Injection equipment should be clean and sterilized.
- Avoid vaccine exposure to bright light or high temperatures.
- Do not inject the vaccine intramuscularly and not in the head, leg or neck regions.
- Do not vaccinate during laying or 21 days or less prior to slaughter. A local reaction may occur at the site of injection. It will disappear after a period of time.
- Avoid self-injection with the vaccine. Consult a physician immediately in case of self-injection with the vaccine.
- Do not freeze the vaccine, defrosted vaccine should not be used.

Storage
Store in the refrigerator (2°-8°C)

Package
Bottles of 500 ml (1000 doses)
